

Alejandro Vollbrechthausen & Michael
Homework 2 Comp 40
02/2/2017

During coding we always test on the way. As soon as we finish a function we test it to see if we are getting the results we want. This allows for us to assure us that everything is working and if we do get a mistake it makes it incredibly easy to locate the issue. Knowing that a specific part of the code works flawlessly allows us to then test other parts of the code and debug them without worrying about the other parts.

We should comment more as we code to make it easier to go back and work through errors. several times we write code then go back and realize that we made a mistake or not even a mistake but working code that is complicated that we made days before and then have to figure out why it works to continue coding. Also commenting on the go allows us to be able to finish coding and fully comment things much easier.
